Example 1: Algebra - Solving Linear Equations

Problem: Solve for x : $3x + 7 = 16$

Solution:

1. Subtract 7 from both sides: $3x = 9$
2. Divide both sides by 3: $x = 3$

Explanation: This problem requires understanding the basic principles of solving linear equations. By applying inverse operations (subtraction and division), we isolate the variable ' x ' and find its value.

Example 2: Geometry - Calculating Area

Problem: Find the area of a rectangle with length 10 cm and width 5 cm.

Solution:

$$\text{Area} = \text{Length} \times \text{Width} = 10 \text{ cm} \times 5 \text{ cm} = 50 \text{ cm}^2$$

Explanation: This problem requires knowledge of the formula for calculating the area of a rectangle. The solution involves substituting the given values into the formula and performing the calculation.

Example 3: English Language Arts - Identifying Verb Tenses

Problem: Identify the verb tense in the sentence: "She had walked to the store."

Solution: Past Perfect Tense

Explanation: This problem requires understanding different verb tenses in English grammar. The past perfect tense indicates an action completed before another action in the past.

Example 4: Science - Calculating Average Speed

Problem: A car travels 100 km in 2 hours. What is its average speed?

Solution:

Average Speed = Distance / Time = 100 km / 2 hours = 50 km/hour
