sands accounting: Seismic Petrophysics in Quantitative Interpretation Lev Vernik, 2016-10-15 Exploration and characterization of conventional and unconventional reservoirs using seismic technologies are among the main activities of upstream technology groups and business units of oil and gas operators. However, these activities frequently encounter difficulties in quantitative seismic interpretation due to remaining confusion and new challenges in the fast developing field of seismic petrophysics. Seismic Petrophysics in Quantitative Interpretation shows how seismic interpretation can be made simple and robust by integration of the rock physics principles with seismic and

petrophysical attributes bearing on the properties of both conventional (thickness, net/gross, lithology, porosity, permeability, and saturation) and unconventional (thickness, lithology, organic richness, thermal maturity) reservoirs. Practical solutions to existing interpretation problems in rock physics-based amplitude versus offset (AVO) analysis and inversion are addressed in the book to streamline the workflows in subsurface characterization. Although the book is aimed at oil and gas industry professionals and academics concerned with utilization of seismic data in petroleum exploration and production, it could also prove helpful for geotechnical and completion engineers and drillers seeking to better understand how seismic and sonic data can be more thoroughly utilized.

sands accounting: The Routledge Companion to Accounting Education Richard M.S. Wilson, 2014-04-29 Many enquiries into the state of accounting education/training, undertaken in several countries over the past 40 years, have warned that it must change if it is to be made more relevant to students, to the accounting profession, and to stakeholders in the wider community. This book's over-riding aim is to provide a comprehensive and authoritative source of reference which defines the domain of accounting education/training, and which provides a critical overview of the state of this domain (including emerging and cutting edge issues) as a foundation for facilitating improved accounting education/training scholarship and research in order to enhance the educational base of accounting practice. The Routledge Companion to Accounting Education highlights the key drivers of change - whether in the field of practice on the one hand (e.g. increased regulation, globalisation, risk, and complexity), or from developments in the academy on the other (e.g. pressures to embed technology within the classroom, or to meet accreditation criteria) on the other. Thirty chapters, written by leading scholars from around the world, are grouped into seven themed sections which focus on different facets of their respective themes - including student, curriculum, pedagogic, and assessment considerations.

sands accounting: Life After Growth (2nd) Tim Morgan, 2016-10-03 NEW EDITION WITH ADDITIONAL INTRODUCTION AND END NOTE FROM THE AUTHOR Why, years after the banking crisis, is the global economy still mired in recession and burdened by enormous debts? Why have the

tried-and-tested economic policies of the past failed us this time? In *Life After Growth*, leading City analyst Tim Morgan sets out a ground-breaking analysis of how the economy really works. Economists are mistaken, he argues, when they limit their interpretation of the economy to matters of money. Ultimately, the economy is an energy system, not a monetary one. From this, it follows that we need to think in terms of two economies, not one - a 'real' economy of work, energy, resources, goods and services, and a parallel, 'financial' economy of money and debt. These two economies have parted company, allowing the financial economy to pile up promises that the real economy cannot meet. Starting with the discovery of agriculture, Tim Morgan traces the rise of the economy in terms of work, energy and resources. The driving factor, he explains, has been cheap and abundant energy. As energy has become increasingly costly to obtain, the potential for prosperity has diminished, to the point where growth in the real economy has ceased. An immediate problem is that our commitments - including debt, investments and welfare promises - cannot be honoured, which means that we can expect the financial system to be wracked by value destruction. At the same time, we need to adapt to a future in which prosperity can no longer be taken for granted.

First World Petro-Politics examines the vital yet understudied case of a first world petro-state facing related social, ecological, and economic crises in the context of recent critical work on fossil capitalism. A wide-ranging and richly documented study of Alberta's political ecology - the relationship between the province's political and economic institutions and its natural environment - the volume tackles questions about the nature of the political regime, how it has governed, and where its primary fractures have emerged. Its authors examine Alberta's neo-liberal environmental regulation, institutional adaptation to petro-state imperatives, social movement organizing, Indigenous responses to extractive development, media framing of issues, and corporate strategies to secure social license to operate. Importantly, they also discuss policy alternatives for political democratization and for a transition to a low-carbon economy. The volume's conclusions offer a critical examination of petro-state theory, arguing for a comparative and contextual approach to understanding the relationships between dependence on carbon extraction and the nature of political regimes.

sands accounting: Risk-Sharing Finance Saad Bakkali, Abbas Mirakhor, 2021-05-10 The contemporary finance deals mainly with multilateral and multi-counterparty transactions. Islamic Jurisprudence (Fiqh) has yet to develop its conceptualization of this modality of financing. Thus far, it has become a norm for large financing projects to rely on a complex structure of interconnected bilateral contracts that in totality becomes opaque, complex and costly. An unfortunate result of the unavailability of an efficient Fiqhi model applicable to modern multilateral and multi-counterparty contracts has been the fact that the present Islamic finance has been forced to replicate conventional risk-transfer (interest rate based) debt contracts thus drawing severe criticisms of duplicating conventional finance. In 2012, a gathering of some of the Muslim world's most prominent experts in Jurisprudence (Fuqaha) and economists issued the Kuala Lumpur Declaration (Fatwa) in which they identified risk sharing as the essence of Islamic finance. The Declaration opened the door for a new Fiqh approach to take the lead in developing the jurisprudence of multilateral and multi-counterparty transactions. This Declaration (Fatwa) provides a prime motivation to search for a comprehensive model of risk sharing that can serve as an archetypal contract encompassing all potential contemporary financial transactions. From the perspective of Islamic Jurisprudence (Fiqh), the technicalities of the concept of risk sharing in contemporary finance have yet to be defined in Islamic literature. This book attempts to clarify and shed light on these technicalities from the perspective of Fiqh. It is a comprehensive study that relies on the fundamental Islamic sources to establish a theoretical and practical perspective of Fiqh encompassing risk-sharing Islamic finance as envisioned in the Kuala Lumpur Declaration of 2012. This new paradigm should lead to a more efficient approach to multilateral and multi-counterparty Islamic contracts which, here-to-fore has been lacking in the current configuration of Islamic finance.

Resulting from international and regional earthquake research and disaster mitigation collaborations, and written by international authors from multiple institutions and disciplines, it describes methods and techniques in earthquake science based on investigations of the Wenchuan earthquake. It also includes extensive reference lists to aid further research. The book helps both senior researchers and graduate students in earthquake science to broaden their horizons in data analysis, numerical modeling and structural retrieval for the tectonic, geological, geophysical and mechanical interpretation of the 2008 M8 Wenchuan earthquake to support a global and regional cooperation for preparedness, and the mitigation and management of seismic risk.

sands accounting: Numerical Simulation of Pore-scale Heterogeneity and Its Effects on Elastic, Electrical and Transport Properties Ratnanabha Sain, 2010 This dissertation describes numerical experiments quantifying the influence of pore-scale heterogeneities and their evolution on macroscopic elastic, electrical and transport properties of porous media. We design, implement and test a computational recipe to construct granular packs and consolidated microstructures replicating geological processes and to estimate the link between process-to-property trends. This computational recipe includes five constructors: a Granular Dynamics (GD) simulation, an Event Driven Molecular Dynamics (EDMD) simulation and three computational diagenetic schemes; and four property estimators based on GD for elastic, finite-elements (FE) for elastic and electrical conductivity, and Lattice-Boltzmann method (LBM) for flow property simulations. Our

implementation of GD simulation is capable of constructing realistic, frictional, jammed sphere packs under isotropic and uniaxial stress states. The link between microstructural properties in these packs, like porosity and coordination number (average number of contacts per grain), and stress states (due to compaction) is non-unique and depends on assemblage process and inter-granular friction. Stable jammed packs having similar internal stress and coordination number (CN) can exist at a range of porosities (38-42%) based on how fast they are assembled or compressed. Similarly, lower inter-grain friction during assemblage creates packs with higher coordination number and lower porosity at the same stress. Further, the heterogeneities in coordination number, spatial arrangement of contacts, the contact forces and internal stresses evolve with compaction non-linearly. These pore-scale heterogeneities impact effective elastic moduli, calculated by using infinitesimal perturbation method. Simulated stress-strain relationships and pressure-dependent elastic moduli for random granular packs show excellent match with laboratory experiments, unlike theoretical models based on Effective Medium Theory (EMT). We elaborately discuss the reasons why Effective Medium Theory (EMT) fails to correctly predict pressure-dependent elastic moduli, stress-strain relationships and stress-ratios (in uniaxial compaction) of granular packs or unconsolidated sediments. We specifically show that the unrealistic assumption of homogeneity in disordered packs and subsequent use of continuum elasticity-based homogeneous strain theory creates non-physical packs, which is why EMT fails. In the absence of a rigorous theory which can quantitatively account for heterogeneity in random granular packs, we propose relaxation corrections to amend EMT elastic moduli predictions. These pressure-dependent and compaction-dependent (isotropic or uniaxial) correction factors are rigorously estimated using GD simulation without non-physical approximations. Further, these correction factors heuristically represent the pressure-dependent heterogeneity and are also applicable for amending predictions of theoretical cementation models, which are conventionally used for granular packs. For predicting stress-ratios in uniaxial compaction scenario, we show the inappropriateness of linear elasticity-based equations, which use elastic constants only and do not account for dissipative losses like grain sliding. We further implement and test a computational recipe to construct consolidated microstructures based on different geological scenarios, like sorting, compaction, cementation types and cement materials. Our diagenetic trends of elastic, electrical and transport properties show excellent match with laboratory experiments on core plugs. This shows the feasibility of implementing a full-scale computational-rock-physics-based laboratory to construct and estimate properties based on geological processes. However, the elastic property estimator (FE simulation) shows limitations of finite resolution while computing elastic properties of unconsolidated sediments and fluid-saturated microstructures.
