alpas wellness la plata photos: More than Beef, Pork and Chicken - The Production, Processing, and Quality Traits of Other Sources of Meat for Human Diet José Manuel Lorenzo, Paulo E. S. Munekata, Francisco J. Barba, Fidel Toldrá, 2019-01-31 This comprehensive work explores the demand, supply and variable consumer attitude toward a wide variety of unconventional and exotic animal species that are consumed in different parts of the world. Individual chapters focus on the consumption of horse meat, camel, buffalo, sheep, rabbit, wild boar, deer, goose, pheasant and exotic meats such as alligator, snake, frog and turtle. For each type of animal species, the carcass characteristics, physico-chemical properties and nutritional value of the meat are extensively outlined. The consumer preference, behavior and perception of each type of meat are also covered, with focus on important factors from sensory properties to psychological and marketing aspects. In promoting a better understanding of the complexities involved in consumer decision making, this book aims to improve the competitiveness of the meat industry through effective informational strategies that can increase consumer acceptance of more convenient, healthy and environmentally friendly meat choices. More than Beef, Pork and Chicken - The Production, Processing, and Quality Traits of Other Sources of Meat for Human Diet also focuses on the important role meat plays in the human diet and the evolution of the species. Beneficial factors such as protein, B complex vitamins, zinc, selenium and phosphorus are detailed. Negative factors are discussed as well, with issues such as fat and fatty acid content being addressed for each type of meat presented. In exploring the full range of nutritional benefits, consumer acceptance and carcass characteristics in a large quantity of different types of animal meats from all over the world, this book offers incredible value to researchers looking for a single source on unconventional meat processing.

alpas wellness la plata photos: Should We Eat Meat? Vaclav Smil, 2013-03-18 Meat eating is often a contentious subject, whether considering the technical, ethical, environmental, political, or health-related aspects of production and consumption. This book is a wide-ranging and interdisciplinary examination and critique of meat consumption by humans, throughout their evolution and around the world. Setting the scene with a chapter on meat's role in human evolution

and its growing influence during the development of agricultural practices, the book goes on to examine modern production systems, their efficiencies, outputs, and impacts. The major global trends of meat consumption are described in order to find out what part its consumption plays in changing modern diets in countries around the world. The heart of the book addresses the consequences of the massive carnivory of western diets, looking at the inefficiencies of production and at the huge impacts on land, water, and the atmosphere. Health impacts are also covered, both positive and negative. In conclusion, the author looks forward at his vision of "rational meat eating", where environmental and health impacts are reduced, animals are treated more humanely, and alternative sources of protein make a higher contribution. *Should We Eat Meat?* is not an ideological tract for or against carnivorousness but rather a careful evaluation of meat's roles in human diets and the environmental and health consequences of its production and consumption. It will be of interest to a wide readership including professionals and academics in food and agricultural production, human health and nutrition, environmental science, and regulatory and policy making bodies around the world.

alpas wellness la plata photos: Hunters, Herders, and Hamburgers Richard W. Bulliet, 2005 Richard W. Bulliet has long been a leading figure in the study of human-animal relations, and in his newest work, *Hunters, Herders, and Hamburgers*, he offers a sweeping and engaging perspective on this dynamic relationship from prehistory to the present. By considering the shifting roles of donkeys, camels, cows, and other domesticated animals in human society, as well as their place in the social imagination, Bulliet reveals the different ways various cultures have reinforced, symbolized, and rationalized their relations with animals. Bulliet identifies and explores four stages in the history of the human-animal relationship-separation, predomesticity, domesticity, and postdomesticity. He begins with the question of when and why humans began to consider themselves distinct from other species and continues with a fresh look at how a few species became domesticated. He demonstrates that during the domestic era many species fell from being admired and even worshipped to being little more than raw materials for various animal-product industries. Throughout the work, Bulliet discusses how social and technological developments and changing philosophical, religious, and aesthetic viewpoints have shaped attitudes toward animals. Our relationship to animals continues to evolve in the twenty-first century. Bulliet writes, We are today living through a new watershed in human-animal relations, one that appears likely to affect our material, social, and imaginative lives as profoundly as did the original emergence of domestic species. The United States, Britain, and a few other countries are leading a move from domesticity, marked by nearly universal familiarity with domestic species, to an era of postdomesticity, in which dependence on animal products continues but most people have no contact with producing animals. Elective vegetarianism and the animal-liberation movement have combined with new attitudes toward animal science, pets, and the presentation of animals in popular culture to impart a distinctive moral, psychological, and spiritual tone to postdomestic life.

alpas wellness la plata photos: Meat-Eating and Human Evolution Craig B. Stanford, Henry T. Bunn, 2001-06-14 When, why, and how early humans began to eat meat are three of the most fundamental unresolved questions in the study of human origins. Before 2.5 million years ago the presence and importance of meat in the hominid diet is unknown. After stone tools appear in the fossil record it seems clear that meat was eaten in increasing quantities, but whether it was obtained through hunting or scavenging remains a topic of intense debate. This book takes a novel and strongly interdisciplinary approach to the role of meat in the early hominid diet, inviting well-known researchers who study the human fossil record, modern hunter-gatherers, and nonhuman primates to contribute chapters to a volume that integrates these three perspectives. Stanford's research has been on the ecology of hunting by wild chimpanzees. Bunn is an archaeologist who has worked on both the fossil record and modern foraging people. This will be a reconsideration of the role of hunting, scavenging, and the uses of meat in light of recent data and modern evolutionary theory. There is currently no other book, nor has there ever been, that occupies the niche this book will create for itself.

alpas wellness la plata photos: Food in the Ancient World Joan P. Alcock, 2005-12-30 The ways of life of four great ancient civilizations— Egyptian, Greek, Roman, and Celtic—are illuminated here through their foodways. As these cultures moved toward settled agriculture, a time of experimentation and learning began. Cities emerged, and with them consumer societies that needed to be supplied. *Food Culture in the Ancient World* draws on writings of classical authors such as Petronius, Galen, and Cato, as well as on archeological findings, to present intimate insight into ancient peoples. This volume will be indispensable as it complements classical history, cultural, and literature studies at the high school and college levels and will also inform the general reader. The book begins with an overview of the civilizations and their agricultural practices and trade. A full discussion of available foodstuffs describes the discovery, emergence, usage, and appraisals of a host of ingredients. A subsequent chapter covers food by civilization. Chapters on food preparation, the food professions, and eating habits provide a fascinating look at the social structure, with slaves and women preparing and serving food. Accounts of the gatherings of slaves and freedmen in taverns, inns, and bars and the notorious banquet, symposium, feast, and convivium of the elite are particularly intriguing and crucial to understanding male society. Other aspects of ancient life brought to life for the reader include food for soldiers, food in religious and funerary practices, and concepts of diet and nutrition. Many Classical recipes are interspersed with the text, along with illustrations.

alpas wellness la plata photos: A Movable Feast Kenneth F. Kiple, 2007-04-30 Pepper was once worth its weight in gold. Onions have been used to cure everything from sore throats to foot fungus. White bread was once considered too nutritious. From hunting water buffalo to farming salmon, *A Movable Feast* chronicles the globalization of food over the past ten thousand years. This engaging history follows the path that food has taken throughout history and the ways in which humans have altered its course. Beginning with the days of hunter-gatherers and extending to the present world of genetically modified chickens, Kenneth F. Kiple details the far-reaching adventure of food. He investigates food's global impact, from the Irish potato famine to the birth of McDonald's. Combining fascinating facts with historical evidence, this is a sweeping narrative of food's place in the world. Looking closely at geographic, cultural and scientific factors, this book reveals how what we eat has transformed over the years from fuel to art.

alpas wellness la plata photos: The Dopaminergic Mind in Human Evolution and History Fred H. Previc, 2009-05-14 What does it mean to be human? There are many theories of the evolution of human behavior which seek to explain how our brains evolved to support our unique abilities and personalities. Most of these have focused on the role of brain size or specific genetic adaptations of the brain. In contrast, in this text, Fred Previc presents a provocative theory that high levels of dopamine, the most widely studied neurotransmitter, account for all major aspects of modern human behavior. He further emphasizes the role of epigenetic rather than genetic factors in the rise of dopamine. Previc contrasts the great achievements of the dopaminergic mind with the harmful effects of rising dopamine levels in modern societies and concludes with a critical examination of whether the dopaminergic mind that has evolved in humans is still adaptive to the health of humans and to the planet in general.
